Cyclic group: (generated by a single element)

A group G is called a cyclic group if there is an element $a \in G$ s.t

$$G = \{a^n : n \in Z\}$$

denoted as: $G = \langle a \rangle$

In this case, 'a' is called a generator of G.

i.e $[x \in G = \langle a \rangle \Rightarrow x = a^n : n \in Z]$

$a^n \to n \cdot a$

Eg: $G = (Z, +)$.

Then G is a cyclic group generated by 1. It can also be generated by -1.

If 'a' is a generator of G, then

a^{-1} is also a generate of G.

$Z_n := \{0, 1, 2, \cdots n-1\}$. is a cyclic group (can be) generated by: 1 and n-1.

In Z_8;

Cosets and Lagrange's Theorem

Let G be a group and H be a subgroup of G.

Define a set $aH = \{ah : h \in H\}$;

Here $a \in G$.

We call aH, a left coset of H in G.

Similarly $Ha = \{ha : h \in H\}$ is a right coset of H in G.

Eg: $G = \mathbb{Z}_9$; $H = \{0, 3, 6\}$

The list all the left cosets of H in G.

$0 + H = H$ ✓

$1 + H = \{1, 4, 7\}$

$4 + H = \{4, 7, 1\} = 1 + H$

$5 + H = 2 + H$

$6 + H = H$ ✓

$7 + H = 1 + H$

$8 + H = 2 + H$

In total, H, $1+H$, $2+H$ are three distinct cosets of H in G.

Note that cosets are not subgroups in

general.

Some properties of Cosets.

(i) $aH = H$ iff $a \in H$.

(ii) either $aH = bH$ or $aH \cap bH = \phi$. In particular

(iii) $|aH| = |bH| \quad \forall\ a, b \in G$. $(|aH| = |H|)$

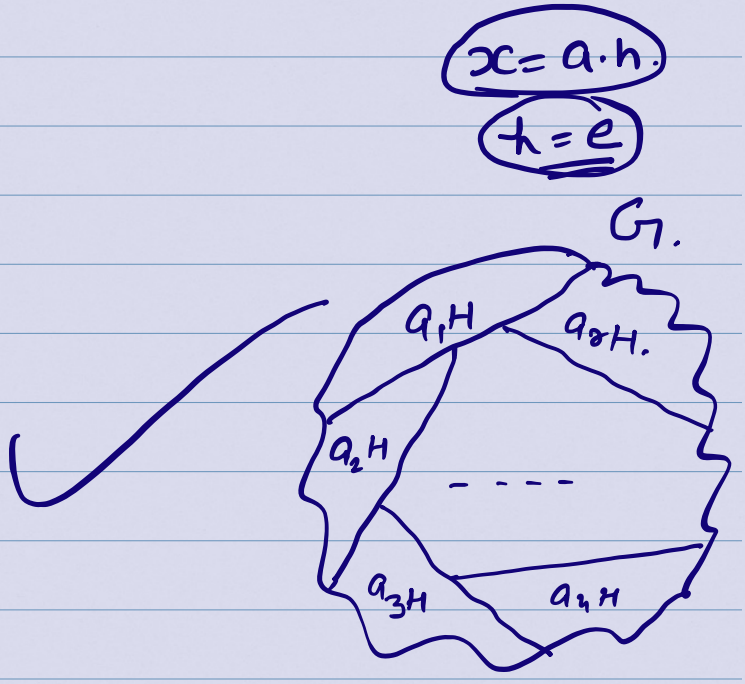
(iv) aH is a subgroup of $G \Leftrightarrow a \in H$. $(aH = H)$

(v) $a \in aH$.

@ $x \in aH$.

$x = a \cdot h$.

$h = e$



Lagrange's Theorem

If G is a finite group and H is a subgroup of G:, then $O(H)$ divides $O(G)$.

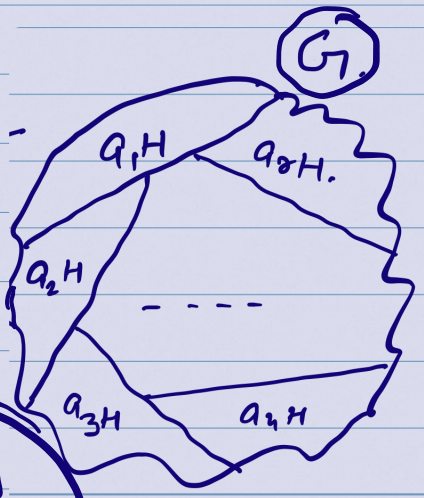
$$\Rightarrow \boxed{G = a_1 H \cup a_2 H \cup \dots \cup a_r H.}$$

we have:

(i) $|aH| = |bH| = |H| \quad \forall a, b \in G.$

(ii) $aH \cap bH = \phi$ if $aH \neq bH.$



$$|G| = |a_1 H| + |a_2 H| + \dots |a_r H|$$
